

# Microsoft AI Tour

BRK 231

# Trusted AI at scale: Foundry to Agent 365

Dona Sarkar

# Agenda

Act 1: Understand the AI Scale Challenge

Act 2: Build Conversational Agents grounded in business data

Act 3: Fine-tune AI models with business data and build AI apps and agents

Act 4: Govern your AI workloads

Act 5: What have we learned today?

Act 1

# Understand the AI Scale Challenge

Problem

**Who here has attempted to  
build and deploy AI workloads  
in the past year?**

**So have our friends over at...**

**CALDOVA**

# CALDOVA

## Pharmaceuticals

Medicine moves faster when intelligence moves with it.

A global pharmaceutical company modernizing manufacturing, supply chain, and procurement with AI to bring life-improving medicines to market faster.

The urgent challenge

**A sudden manufacturing capacity gap threatens continuity for customers.**

The executive team must respond with an AI-native operating mindset, without slowing delivery.

01

MANUFACTURING

### Find capacity

See where production can flex and where external support is needed.

02

SUPPLY CHAIN

### Protect flow

Connect supply, quality, and delivery signals before disruption spreads.

03

PROCUREMENT

### Move with evidence

Compare suppliers, obligations, and risks with trusted business context.

Leading the way for AI-driven innovation are...

# CALDOVA Org Chart

CEO  
Kayo Miwa

# Why is it so hard to move from Pilot to Scale?

Not the best scenario  
for Generative AI

Lack of a clear benefit  
to the users

Lack of data readiness  
for the specific task

Lack of adoption  
planning

**No one knows where or how  
the AI workload should live or  
be governed and maintained**

# From agent idea to enterprise-wide operations

One connected system to build, ground, secure and govern, then scale agents across the enterprise

Act 2

# Build Conversational Agents on business data

# Supplier contracts become decision intelligence

Charlotte Waltson | VP of Procurement

A sudden demand surge creates a manufacturing capacity gap. Charlotte needs to identify which contract manufacturers can support production without compromising quality, compliance, cost, or delivery.

“Which supplier can take on additional tablet production with the fewest contract changes?”

- 1

UNDERSTAND

Interprets capabilities and obligations hidden in supplier contracts
- 2

COMPARE

Evaluates capacity, regulatory, quality, commercial, and delivery terms
- 3

RECOMMEND

Returns an evidence-backed supplier recommendation with clear risks

CONTRACT COVERAGE

Compression · coating · inspection · packaging

SUPPLIER COMPARISON

Capacity · quality · compliance · commercial

RECOMMENDATION

Best-fit supplier with evidence and risks

Charlotte Waltson

VP of Procurement

SUPPLIER INTELLIGENCE AGENT

Grounded in contracts, sourcing policies, and supplier data

OUTCOME

Faster, defensible procurement decisions that help critical medicines reach patients on time.

COPILLOT STUDIO · CONTRACTS · SOURCING POLICIES · SUPPLIER DATA

# Copilot Studio is your enterprise-grade agent platform

[copilotstudio.microsoft.com](https://copilotstudio.microsoft.com)

Real business value

Open, integrated ecosystem

GenAI + traditional automation

GitHub Copilot harness

Choice of channels

Robust governance and security

# Why customers build agents with Copilot Studio

## Real business value

Customers have improved customer satisfaction, cut costs, and innovated faster

## Open and integrated ecosystem

Access to your data through WorkIQ, 11K models, 1400+ connectors and MCPs

## GenAI + traditional automation

Optimize process flexibility and control by using AI and traditional workflows in the same system

## GitHub Copilot harness

Enable agents to find solutions to your most complex workflows for consistent, efficient results

## Choice of channels

Make it easy for customers, partners, and employees to get value from agents by publishing where they are

**Robust governance model and security measures**

 Open, integrated ecosystem

# Agents run your business processes by connecting to your data and systems

Use existing knowledge, tools, and multi-agent systems to build custom agents in a fraction of the time

...and many more

## Business processes aren't always linear – they require both deterministic workflows and AI

Non-deterministic

Deterministic

Hybrid

Mix traditional and agentic automation to optimize speed and flexibility

## Now, agents can handle your most complex business processes with the GitHub Copilot Harness

### Solves challenging workflows

Breaks a task into steps and iterates until it's done, sharing interim updates along the way.

### Adapts and recovers on its own

Responds to changing requests and errors, automatically retrying failed steps or alternative paths.

### Accurate tool calling

Selects the right tool and fills in parameters correctly the first time, following instructions across long conversations.

### Optimization of model performance

Stronger instruction adherence and a higher cache rate mean more reliable output with lower net token use.

 Choice of channels

## Publish to your channels to reach customers and employees where they are

Employees

Customers

# The Copilot Studio Model

## Instructions

- Everything that is **general**: role, scope, tone, safety rules
- Always-on guidance

## Knowledge

- **Searchable/semantic** facts
- Docs, sites, files
- Ground responses

## Tools

- Live lookups / APIs
- CRUD operations
- Actions on **external systems**

## Memory

- Persistent context
- **Per-user preference** history

## Agent Sandbox (Code Execution)

- Ad hoc analysis
- Run code / shell tools
- **Data manipulation**

## Skills

Reusable procedures the loop can invoke when a task needs a specific workflow

### SKILL.md

- Textual procedure or context **useful for a specific topic or task**
- Can influence future planning decisions
- Can suggest a flow (but not enforce it)

### Skill supporting files

- Python or helper files, runs in a sandbox. Can use a set of libraries. No outbound.
- Complex local logic, or data processing
- Only if the orchestrator reads the skill

## Connected agents

- Delegate specialized scope **only if needed**
- Own instructions / tools / skills / knowledge
- Useful for large sub-domains that require a different orchestration of skills and tools
- Except for large scenarios, splitting small tasks into connected agents **doesn't increase** the accuracy

Enterprise Governance

# Demo: Building a Conversational Agent Using Microsoft Copilot Studio

Dona Sarkar

-  **Copilot Studio** 
-  Home
-  Operate
-  Chat
-  Agents
-  Workflows

# Hey Dona, what do you want to

Optimize your business processes  Uses Copilot Credits

**Agent** 

Create an agent to take actions and answer questions.

**Workflow** 

Automate multi-step processes with triggers, actions, AI steps.

**Other ways to build**  
Create agents that extend Microsoft 365 Copilot, or build standard agents and automated flows with rule-based orchestration. 

# From contract search to contract reasoning

Charlotte asks one business question. The agent returns a recommendation and the contract evidence behind it.

“Which suppliers can take on additional tablet production, and which option requires the fewest contract changes?”

Charlotte Waltson,  
VP of Procurement

Why this is different

## The agent does not just find the contract

It interprets scope, checks exceptions, and shows Charlotte exactly which clauses support the recommendation.

Supplier intelligence agent

Grounded

## Recommended starting point: Aster Ridge Biomanufacturing

The existing SOW already covers the core manufacturing scope for ALLER tablets.

Tablet compression: Covered

Film coating: Covered

Visual inspection: Covered

Standard bottle packaging: Included

Watch item: Blister packs or market-specific cartons still require written authorization.

Act 3

**Fine-tune AI models with  
business data and build  
AI apps and agents**

# Invoice assurance agent

## Sarah Perez | AI App Developer

Invoices from contract manufacturers rarely match their governing agreements. Sarah built an invoice assurance agent to solve this problem.

Sarah tells her manager, Kian how their agent proves what each invoice line is supported by, but they have hit a ceiling in quality, and every new model is adding extra cost per assurance request.

“Can we maintain the quality of our agent but scale it further without increasing cost and latency”

- 1

RETRIEVE 

Pulls relevant clauses, pricing schedules, rate cards, and policies using Foundry IQ
- 2

EVIDENCE 

Links each invoice line to the governing contractual evidence
- 3

OPTIMISE

Fine-tune smaller model on production agent traces in Microsoft Foundry

ASSURANCE CHECK  
Invoice lines matched to supporting clauses and prior findings

EVALUATION OUTCOME  
Shows acceptable quality but increasing costs and latency at scale

FINE-TUNING  
Production Agent traces distilled into a smaller, cheaper model

Sarah Perez

AI App Developer

CONTRACT-EVIDENCE AGENT

Grounded in contracts, policies, and prior assurance findings

OUTCOME

Faster, defensible invoice assurance at lower cost.

MICROSOFT FOUNDRY · FINE TUNING · POLICIES · AGENT TRACES

Caldova Pharmaceuticals

**Can we optimize cost, quality and speed of  
our agent?**

# Microsoft Foundry

## Run in Foundry

Optimize models, prompts, skills, and tools.

**Agent runtime**  
plan / act / observe  
host & scale

**Evaluate & Optimize**

agents & eval signals

AI Models – 11K models

Context with IQ – *your* enterprise context

Security + Control

# Microsoft Foundry

# Fine-tuning a foundation model

# From agent traces to training data

New

turn production traces into a fine-tuning dataset in one click

Your production agent traces are training data hiding in plain sight.

Every successful tool call, every recovered failure, every accepted answer labeled examples for the next model.

# A smaller, tuned model matches frontier accuracy — at 10× the cost-efficiency.

## MYTH

“I don’t need to fine-tune — frontier models keep getting smarter.”

## REALITY

Frontier models keep getting **bigger and more expensive**. A tuned small model can match them on quality — and beat them on price.

## Matches frontier-class accuracy.

Weighted Pass Rate, internal eval (higher is better)

## ...at >10× more output per dollar.

Output Tokens per Dollar, indexed to GPT 5.5 (higher is better)

# Govern agents at scale

## Challenge

What agents can we manage and how do we do it at scale?

## Challenge

How do we capture agent activities to stay audit-ready and compliant?

Unethical or risky agent interactions go undetected

Lack of clear visibility into agent actions

Inability to retain and investigate agent interactions for compliance

# Establish guardrails for agents and users

Can you apply consistent governance policies across all agents, regardless of how they're built or where they run?

How do you balance developer freedom and experimentation with centralized oversight?

Are you able to identify and retire low-value or ownerless agents before they create risk or cost?

➔ 21%

of companies report having a mature model for governance of autonomous agents

# Govern

Generally available

## Bring agents under control from day one

Onboard and approve agents through one IT-controlled flow, applying policy templates so every agent starts governed and compliant.

# Govern

Generally available

## Control what agents can access and do

Enforce least-privilege access by controlling which users, data, tools, and MCP servers agents can use. Limit access to only the resources and other agents they need.

# Govern

Generally available

## Automate on-going agent governance

Leverage rules-based agent management to automatically enforce lifecycle policies, such as expiring inactive agents, flagging ownerless agents, or blocking risky agents.

The screenshot displays the Microsoft 365 admin center interface, specifically the 'Agent management rules' section. The left sidebar shows the navigation menu with options like Home, Copilot, Agents, Overview, All agents, MCP Connectors, Settings, Users, Devices, Teams & groups, Roles, Resources, Billing, Support, Setup, Reports, Health, and Admin centers. The main content area is titled 'Agent management rules' and includes a search bar, a breadcrumb trail (Home > Agent settings > Agent management rules), and a description: 'Create rules for agents that run automatically based on conditions, or require review and approval before taken.' Below this, there are two summary boxes: 'Pending agents 5' and 'Processed agents 38'. A 'Status' filter is set to 'Rule'. A list of rules is shown, with the rule 'Reassign ownerless agents created with Agent Builder to manager' selected, indicating '5 agents pending'. On the right, a modal window titled 'Reassign ownerless agents created with Agent Builder to manager' is open, showing a table of agents and their managers.

| Agent                  | Manager           | Total sessions | Active users |

# Agent management spans every role...

## Dev teams...

must build agents, test them, and ensure guardrails are applied then observe them in production

### They need to:

- Build agents that are secure and compliant by default, apply consistent guardrails
- Ensure AI models are evaluated for safety guardrails and security vulnerabilities
- Monitor runtime behavior, cost, and performance
- Understand risks across models, agents, and tools

## IT teams...

are accountable for enabling and governing every agent running in the environment

### They need to:

- Prevent agent sprawl, ensure agent oversight and manage agent lifecycle
- Observe agent behavior, usage and impact
- Apply consistent policies across collaboration tools (email, files, apps)
- Detect risk factors like over-permissioned agents
- Prove compliance and audit readiness

## Security teams...

must protect the organization's entire AI landscape

### They need to:

- Protect agent identities and their access to resources
- Enforce least privilege access and guardrails
- Prevent data oversharing and leaks
- Protect agents from threats and vulnerabilities
- Meet regulatory and compliance obligations

# Act 5: What have we learned today?

# Key Takeaways

Trusted AI requires **more than building models & agents**

Organizations need a connected platform **for creation, orchestration, governance, and operations.**

Microsoft Foundry, GitHub Copilot, Microsoft Copilot Studio and Agent 365 gives you an end-to-end story **to move your AI projects from pilot to enterprise-wide scale**

# Get started with Agent 365

## Get started on your own

As an admin, go to [admin.microsoft.com](https://admin.microsoft.com)

Review self-guided resources to learn, enable, and deploy Agent 365 at your own pace.

[Get started with Agent 365 — Microsoft Learn](#)

[Get started with Agent 365 — Training module](#)

[Microsoft Agent 365 — Microsoft Adoption](#)

## Get started with help

Bring in experts to accelerate onboarding, deployment, and adoption.

### Microsoft FastTrack

Remote, step-by-step deployment and adoption guidance from Microsoft engineers at no additional cost for eligible plans (150+ seats).

[Explore Microsoft FastTrack](#)

### Microsoft Partners

Work with a specialized Microsoft partner to plan, deploy, and scale Agent 365 across your organization.
